Introduction

This document outlines the requirements specification for a new productivity suite of software, Dolendar, a revolutionary calendar that is developed by the INF43 Software Engineering group and contracted by the founder and president of DoMore Software corp., Dom Dones. What makes Dolendar apart from other calendar apps is that the tasks in Dolendar will flow around the calendar as time moves. If a task is completed, it will disappear from the calendar and the next task will slide up and all of the following tasks will also slide up. If a task is not completed within its duration, the current task and all other tasks will be pushed back.

By investing in the development of Dolendar, Dom Dones, the founder and president of DoMore Software corp., aims to combine a typical calendar app with a to-do list manager to help users manage their time more efficiently and combat procrastination.

Executive Summary

Dolendar is a combination of a calendar and a to-do list. Its primary goal is to help its users manage their time more efficiently and combat procrastination.

Dolendar has two views, calendar view and to-do list view. The to-do list view outlines all tasks the user has. The calendar view also has two different views, weekly view and day view.

What makes Dolendar different than other calendar apps are that when users complete their tasks, the next task will slide up to the current time block. However, if a task is not completed before it is due, the task will stay at the current time and all the following tasks will get pushed back. This way can help users to visualize the effect of procrastination. Users can put tags on their tasks, and they can filter out other tasks and have tasks with the appropriate tag only.

The first version of Dolendar will be available on mobile devices such as iOS and Android. It will be able to sync with Google Calendar and iCalendar. The second version will support desktop platforms such as Windows, Mac, Linux, etc.

The app is free to use so user data is stored locally on users' devices and there is no need to maintain cloud service. The app offers subscription where users can sync their data to the cloud. The subscription also allows users to share, create and assign new tasks to other users.

App integration with other calendar apps such Microsoft Outlook, etc., is planned in the future. Weekly summary may be implemented in the future.

Application Context / Environmental Constraints

The first version of Dolendar is going to be available on mobile devices only such as Apple iPhone(iOS), Android phones and tablets. The app is installed on the devices themselves. At the time of release, the app will be compatible with the current version of iOS and Android and the one prior.

The desktop version of Dolendar will be available in the second version. The app will be available on desktop platforms such as Windows, Mac and Linux.

There is no specific programming language required.

The app is expected to be run primarily on mobile devices as most people would track their daily tasks on their mobile phones. Users can store their data on their phones locally. For desktop users, they are expected to be run in office where employers can assign tasks to their employees with collaborate features. The app is free to use, and it is not necessary to create an account. Users have the option to create an account which can potentially unlock paid tier features where users can work collaboratively. Users can share their tasks with other users. Users can create new tasks for other users.

The UI provides calendar view and to-do list view. The calendar view has both weekly view and day view. The to-do list view outlines all tasks. The UI should be elegant, intuitive and easy to use. Further details will be discussed with the UI engineers.

Additional app integration is planned in the future where it can sync with other calendar apps such as Microsoft Outlook, etc.

Functional Requirements (we will save this section, as well as the use cases for Homework 2)

TBD.

Non-functional Requirements

Usability:

Creating new tasks and events should be straightforward. All tasks must have a default duration without the need to set duration each time creating a new task. Tasks also have the option to have a due date. Sub-tasks can be created to form a task.

Security and Privacy: All user data is encrypted on our server. Users can mark their tasks private, and no one shall see others' private tasks in collaboration mode. There is no parental control. The app is suitable for all ages.

Subscription:

The subscription allows users to sync their data to the cloud which then can be synced between different devices. The app also has collaboration features that are subscription based. Without the collaboration features, all user data stores locally on their own devices. The subscription is the primary source of income. Users will get notification if they are assigned new tasks.

Quality:

Efficiency:

Adaptability:

Portability:

Other Requirements

We often feel we have more to say, in other words somehow the previous two sections did not cover all requirements. This is the place to do it! Any requirements that you are aware of can be described here; you can also add diagrams or other visuals that did not fit in previous sections.

Budget:

\$1,000,000 for the first version of the software.

\$1,000,000 for the second version of the software.

Total Budget: \$2,00,000

Projected Timeline:

First version: October 31st, 2024

Second version: April 30th, 2025

User Interface:

The UI has two different views. The calendar view and to-do list view. The to-do list view outlines all tasks you have. The calendar view also has two different views, the weekly view and the day view. All the events are displayed in the calendar view. The weekly view displays Sunday to Saturday from left to right with time stamps from top to

bottom. The day view also displays the time stamp from top to bottom. However, it can display more details of each task with the extra room. When a task is completed, the task will disappear from the calendar and the next task will flow forward and form a new time block. The length of the new time block might be different than the completed task because every task may have a different duration. Users can use tags to mark their tasks with different labels. Users can filter out tasks and only see the tasks with specific tags.

Users should take minimum effort to create a task. The app has a default color theme and a dark theme. The app also has user-defined color theme that users can customize their own color. Users can also customize their tasks with different color.

Glossary

- Dolendar: a revolutionary calendar which combines a to-do list and traditional events one may find in a calendar app.
- Task: an item in the to-do list. It has duration which should be completed within its specific time windows. If it is not completed within its specific time window, it automatically flows down to the next time windows.
- Sub-task: an item exists in a main task. A main task can have multiple sub-tasks. All sub-tasks' duration make up the duration of the main task.
- Event: a traditional event in most calendar apps. It only happens at a specific time. It does not flow around the calendar unlike tasks.
- Tag: tag is a label on a task. It allows users to filter their tasks with specific tags.
- Time block/window: it indicates how long a task should take and when it should start and end.

Assumptions / Risks

- The collaborate features may not attract enough users to pay for the subscription.
- The market is already flooded with many calendar apps and to-do lists apps.
- Competitors may steal our ideas and implement them in their own apps.
- The cloud has a risk of being hacked and user data being leaked and potentially having legal issues.

Priorities / Implementation Phases

First version:

The first version will focus on the development of mobile platforms. It includes calendar view and to-do list view. Sub-tasks can be created to form a task. It also includes the collaborate features. It is expected to be released October 31st, 2024.

Second version:

The second version will focus on the development of desktop platforms. It is expected to be released 6 months after the release of the first version which is April 30th, 2025.

Future Directions and Expected Changes

Calendar apps integration:

It will be able to sync with other calendar apps such Microsoft Outlook, etc. It will also have integration with Canvas app in the future.

Weekly Summary:

Weekly summary displays how the users managed their data on a weekly basis. It might be made available later.

Mobile widget:

It might be made available later.

Accessibility:

Font size is changeable.
